Representation of the *RPB2* gene according to Liu et al. (1999). The black numbered boxes represent the 12 amino acid regions that are conserved throughout eukaryotes. Positions of the *RPB2* primers used for symmetric PCR amplifications and cycle sequencing reactions are represented by black arrows. Primer names in the table are followed by their degenerate oligonucleotide sequences, their positions relative to the *RPB2* gene sequence of *Saccharomyces cerevisiae* (GenBank Accession No. M15693), and their respective sources.
